## **GOLD TREE COMENCES EXPLORATION AT THE SKYGOLD PROJECT**

**Gold Tree Resources Corp. (CSE: GTX) (“Gold Tree” or the “Company”)** is pleased to announce that it has mobilized a field crew to conduct the first exploration program of 2022 at its Skygold Project (the “Property”) located in British Columbia’s Cariboo Placer Region.

The Company plans to complete a till sampling program to expand the existing sample grid surrounding the highly anomalous and pristine gold grains in-till identified by the Company in 2019. This includes a roughly 1,000 metres by 500 metres gold-in-soil anomaly immediately northeast of Frost Lake. The 2019 till sampling program identified up to 22.5 grams per tonne in sample SGHM-19-15, with up to 180 pristine grains in sample SGHM-19-19.

Analysis of the locally derived till material indicates that a previously unidentified felsic intrusion is present a short distance up-ice from (to the southwest of) the sites where the gold-rich till samples (SGHM-19-19 & SGHM-19-20) were collected.

The newly identified felsic intrusion has undergone weak to pervasive epidote-actinolite alteration and no longer contains any of its primary hornblende and/or biotite. The alteration minerals are suggestive of an incipient endoskarn in the intrusion which may be related to the source of the gold.

Adrian Smith, CEO of GTX comments “we are pleased to be back on ground at the Sky Gold project following up on the highly anomalous gold grain anomalies we discovered in 2019. We believe that the current sampling program will allow us to further delineate and help to identify the source of the gold.”

### **Disclosure**

Adrian Smith, P.Geo., is a Qualified Person (“QP”) as defined by National Instrument 43-101 for the above-mentioned project. The QP is a member in good standing of the Engineers and Geoscientists of British Columbia (EGBC) and is a registered Professional Geoscientist (P.Geo.). Mr. Smith has reviewed and approved the technical information disclosed above.
